

**Results of ALPS Treated Water Marine Monitoring:
Seawater Survey (tritium) (August-September, 2023) * Additional announcement**

1 Outline of survey

(1) Date of sampling

August 25-September 15, 2023

*The present survey (the precise analysis for tritium in seawater) is set to be executed four times a year at a total of 29 sampling points. The analysis results for the samples collected on August 25 were announced on October 30, and this time, analysis results for the remaining samples collected between September 5 and 15 is announced.

(2) Sampling points

27 sampling points on coastal waters in the Fukushima Prefecture, 1 sampling point on coastal waters in the Miyagi Prefecture, and 1 sampling point on coastal waters in the Ibaraki Prefecture.

* Water samples were collected from surface and bottom layers at 23 sampling points within 30 km of ALPS treated water discharge outlet and from surface layer at 6 sampling points beyond 30 km .

* Results announced this time are from 24 sampling points on coastal waters in Fukushima Prefecture, 1 sampling point on coastal waters in Miyagi Prefecture, and 1 sampling point on coastal waters in Ibaraki Prefecture.

(3) Detail of the survey

• The measurement of radioactive material concentrations in seawater. (tritium)

Analysis with target lower limit of detection of 0.1 Bq/L.

* A target lower limit of detection means a value that is set for quality control to assure at least the detection up to the value when analysis is conducted. Each actual lower limit of detection differs according to samples, and is equal to or lower than a target lower limit of detection.

2 Outline of results

(1) Seawater survey (29 sampling points (52 samples))

Concentrations of tritium in seawater range from below the lower limit of detection to 5.0 Bq/L.

* Newly announced results for samples collected in September are in the range of 0.052 to 0.32 Bq/L at 26 sampling points (40 samples).
